## INTRODUCTION

Amongst the most common injuries of the lower limb.

Absence of consensus between orthopedists or physical therapists on the management post immobilisation.

# AIMS OF THE PILOT STUDY

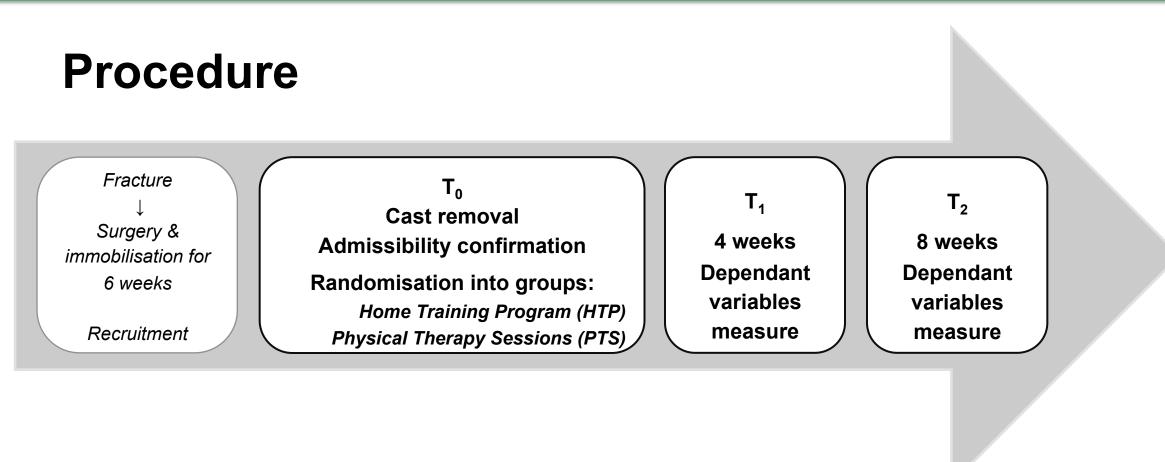

- Demonstrate the plausibility effect;
- Demonstrate the applicability treatment in daily settings;
- Demonstrate the possibility to recruit a large number of participants.

## **METHODOLOGY**

## **Participants**

- •Study Design : pilot study → randomised control trial
- Population : adults with ankle fracture living in Eastern townships
- Inclusion criteria :
  - ≥ 18 years old
  - uni-bi-trimalleolar fracture treated by ORIF
  - 6 weeks cast immobilisation
  - understand treatment instruction
- •Exclusion criteria :
  - past injury on the affected side
  - condition that limits mobility and motricity
  - particular medical condition noted by the orthopedist
- Participant sample :
  - n = 12 Home Training Program (HTP)
    - n = 14 Physical Therapy Session (PTS)

# **Participants screening** HTP PTS Lost Refusal Excluded

## Interventions

Analysis

Home training program			
Goals	Level 1 No weight bearing allowed	Level 2 Weight bearing allowed	Level 3 Weight bearing allowed
Mobility/ Flexibility	<ul> <li>DF and PF</li> <li>inversion and eversion</li> <li>ankle circumduction</li> <li>soleus stretching</li> </ul>	<ul><li>DF knee to wall</li><li>top of the foot stretching</li></ul>	<ul><li>gastrocnemius stretching</li><li>hamstrings stretching</li></ul>
Balance		<ul> <li>one leg stance eyes open</li> </ul>	one leg stance eyes close
Strength	toe flexors strengthening	<ul><li>heels raise two legs stance</li><li>heels walk</li><li>lunges</li></ul>	<ul><li>heels raise one leg stance</li><li>lunges weight in the hands</li></ul>

# METHODOLOGY (continued)

	Physical therapy intervention (8-16 sessions, 2x/week)	IS
Modalities	Anatomic structures	Description
Accessories movements	<ul><li>ant/post glide of talus</li><li>med/lat glide of subtalar joint</li></ul>	<ul><li>grade III</li><li>2 x 10 or 3 x 20 rep</li></ul>
PROM	<ul><li>DF</li><li>inversion</li></ul>	• 3 x 10 or 3 x 20 rep
Passive stretching	<ul><li>ankle dorsal flexors</li><li>ankle plantar flexors</li></ul>	• 1 x 30 or 3 x 30 sec
Contract-relax	ankle plantar flexors	• 3 x 5 or 5 x 5 rep
Massage	<ul><li>calves</li><li>fibular</li></ul>	• 7-8 min
Others : one leg stance on trai	npoline - Biodex balance master - practio	ce in stairs - talocrural

manipulation - scar massage

#### Outcome measures and measurement tools

- Primary Outcome:
  - Lower Extremity Function → LEFS
- **Secondary Outcomes:** 
  - Functional performance -> Kaikonnen scale
  - DF of the ankle (extended and bended knee) -> goniometry

Comparison of progress between HTP

and PTS (T0-T2 difference)

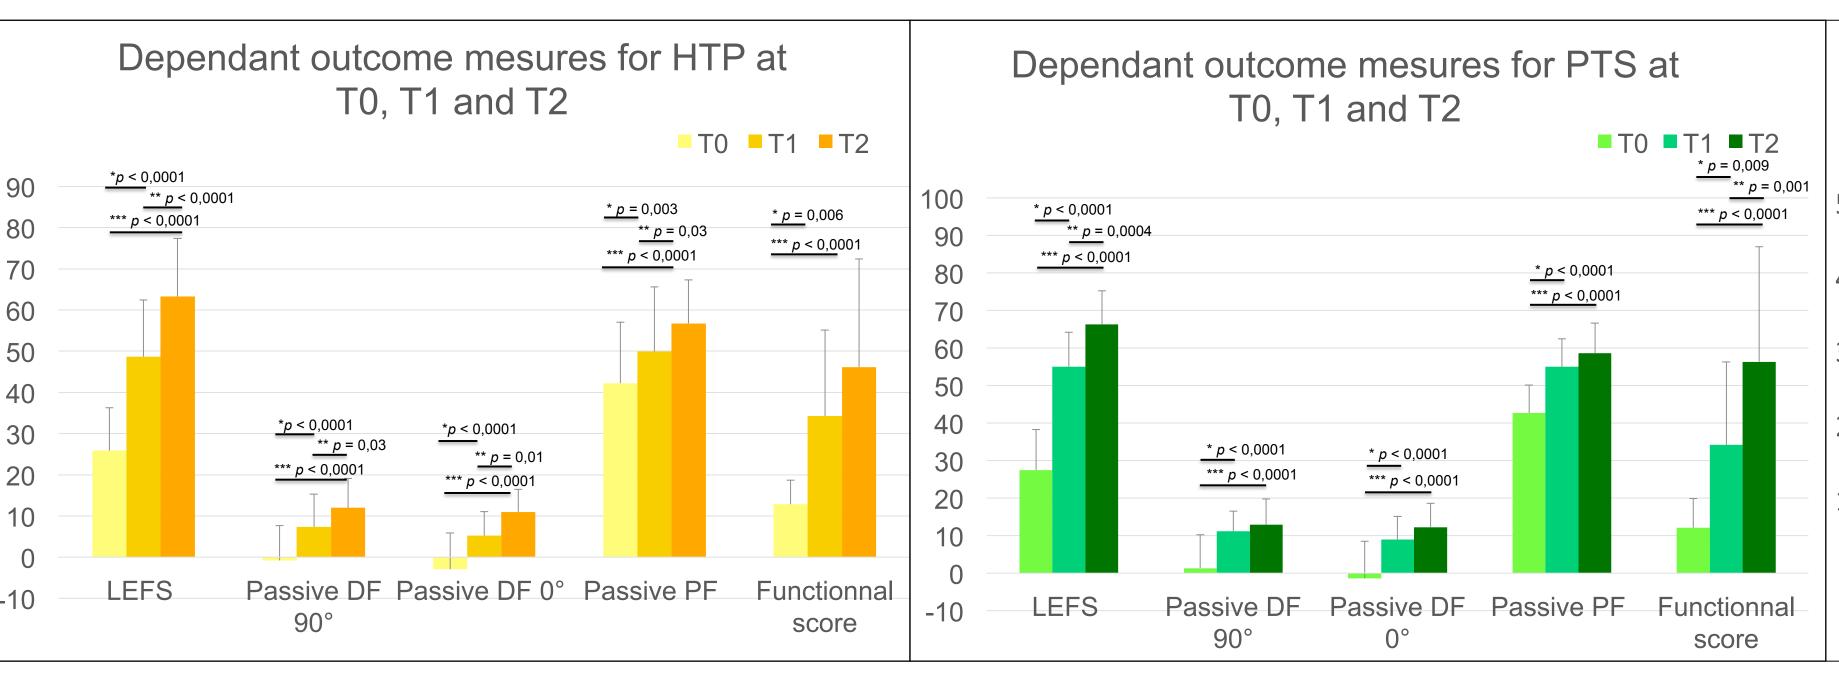

■HTP ■PTS

- PF of the ankle → goniometry
- The intra and inter-group mean (SD) values for each dependant variables and the repeated mixed-design ANOVA results were used for the statistical analysis. The significant p value was < 0,05.

# **RESULTS**

Participants characteristics:

The characteristics for each group participants are as follows: in the HTP group, the mean age, weight and height were 56 (±15,76) years, 73 (±10,76) kg and 167 (±10,46) cm respectively. In the PTS group those values were 47 (±17,76) years, 73 (±14,58) kg and 165 (±10,30) cm. In the HTP group, there were 5 men and 9 women and for the PTS group, there were 5 men and 7 women. The distribution of participants is as follows: in the HTP group 6 participants had a unimalleolar ankle fracture and 8 had a bi/trimalleolar ankle fracture for a total of 14 participants. In the HTP group 6 participants had a unimalleolar ankle fracture and 6 had a bi/trimalleolar ankle fracture for a total of 12 participants.

- There were statistically significant differences for all intra group outcomes between T0-T2.
- The comparison between the HTP and the PTS does not reveal statistically differences in all data collected at all evaluation time.

## DISCUSSION

- Both HTP and PTS groups showed improvement in relation to outcome measures, though there was no statistically significant differences between both
- Difficult to recruit a large number of participants in a relatively short period of time. A second site was added to remedy to this situation.
- A RCT with a large number of participants would allow intra-group stratification, thus allowing us to bear more precise conclusions.
- Procedures are ready for a future RCT.

#### Limitations:

- Interns provided treatment in clinic instead of an experienced physical therapist.
- Time lapse between assessments might have been too spaced apart.

## CONCLUSION

- Both interventions give similar results in terms of efficacy.
- RCT with appropriate sample size is needed in order to validate that the HTP is not inferior to the PTS.
- This pilot study was necessary because it allowed us to make research procedures suitable for a future RCT.

#### **Ethic committee:**

This study protocol has been submitted and accepted by the research ethic committee of Centre de recherche clinique Étienne-LeBel.
